Fund objective

The Solidum Cat Bond Fund is an open-end fund registered in Liechtenstein as a UCITS pursuant to Liechtenstein law in the legal form of a trust (UCITS V). The Fund's objective is to achieve long term capital appreciation and low correlation to fixed income, equity and non-traditional investments. The Fund holds a diversified portfolio of catastrophe bonds or notes and other instruments transferring insurance event risk or genuine insurance underwriting risk. As the insurance event linked securities market evolves, new products may become available and the Fund may also invest in such products. The portfolio is actively managed in an attempt to achieve optimal returns in the context of the prevailing market environment.
In addition to its functional currency USD, the Fund offers CHF and EUR share classes. The equity capital of the CHF and EUR share classes is hedged to reduce effects of FX effects.

Key information

Fund name:	**Solidum Cat Bond Fund**
Strategy	Insurance linked securities
Focus	Catastrophe bonds
Subscription	Weekly
Redemption	Weekly
Redemption notice	10 days

Manager comment

In June 2026, the Fund generated a return of 63 basis points in US dollars. The fully hedged CHF and EUR share classes delivered returns ranging from 32 to 55 basis points.

Although the Fund was not exposed to the severe earthquake sequence in Venezuela, the event dominated the news flow as a major humanitarian disaster.

On the evening of 24 June, a powerful earthquake struck northern Venezuela, approximately 200 km west of Caracas. The Mw 7.5 earthquake was the mainshock of a doublet event, occurring just 39 seconds after an initial Mw 7.2 earthquake. While the difference in magnitude of only 0.3 may appear modest at first glance, this is misleading: owing to the logarithmic nature of the magnitude scale, the second earthquake released approximately three times the energy of the first.

From a seismotectonic perspective, the Caribbean region is highly complex, as the North American, South American, Nazca and Cocos Plates all interact with the comparatively small Caribbean Plate. Along the Pacific coast and, to a lesser extent, the Caribbean Arc, subduction zones are capable of generating very large earthquakes. By contrast, northwestern Venezuela has historically experienced significantly fewer earthquakes, which have generally been of lower intensity.

The June earthquake resulted from shallow strike-slip faulting. In the affected area, the Caribbean Plate moves eastwards relative to the South American Plate at a rate of approximately 20 mm per year. Earthquakes of this magnitude are relatively uncommon in such a tectonic setting.
